

Based on plans in Popular Mechanics, August 1967 pp 148. Dismount legs from existing bench. Mount legs to new 2X short bench and plywood end unit. Mount exist bench to new bench with two hinges mortised deep into new bench. I would use 4.5" square butt hinges. Need a small relief in the bottom of the exist bench for the hinge barrels. Need some type of clamping at each end to keep everything in place. Original bench stays intact so you can go back to original if desired later. Still have full height drill press with the shaper station lower(36" +- shown here). Also based on the table flipping over like the Mk2 allows.
